On the NewForm.aspx, which is the common form for the business and person entities in Dynamics 365, I have a PersonImageField in the 'AdditionalData' Section. I created a handler method to find out the Person entity. private Person GetPerson(int personId) { Person p = new Person(); p.Id = personId; p.FirstName = "Orsa"; p.LastName = "Kuprin"; p.PersonImage = "myimage.png"; p.LastModifiedDateTime = DateTime.UtcNow; p.EntityTypeCode = "Organization"; p.ModifiedBy = User.Identity.Name; p.ModifiedDateTime = DateTime.UtcNow; p.ModificationType = EntityModificationType.Update; return p; } Then i put this into OnEntityUpdated event protected override void OnEntityUpdated(EntityBase entity) { var p = entity as Person; if (p!= null) { p.PersonImage = "myimage.png"; } } But it doesn't work. Just went for another long - on you, 32 bit Win 7 - and installed PyCharm for the first time since 2.5. I like it: it does everything I want it to do (as seen in the screenshot) and was so simple I would expect that it would have been. I just installed this on a new Win7 installation and for some reason it wants to connect to an internet connection. Any suggestions? Another key benefit to using PyCharm IDE rather than any other python ide: It will auto-highlight the code (for any language, not just Python), so you don't. PyCharm is pretty awesome I have not used this as it was recommended before reading that post but he has some good points. PyCharm is best because it will save you a great deal of time. Great for new projects. Pycharm is a great ide for beginners because it is easy to understand, powerful and actually works. The user interface is good and it does not clutter the user with more things than necessary. If you need to work with code or scripts for longer periods of time, I would suggest to find another ide. The installation failed as it is and I forgot the steps to install an msi because I did not want to format my computer and it also crashes. That is a problem because it
