jpg image I hope to get help to crack this one. A: The problem is not with your code but with your scan. If you look at the source of the image file that is returned to you, you will see that it's a JPEG image which is an image format created by the Joint Photographic Experts Group (JPEG). As such, it's not a format that's recognized by OpenCV. If you are looking to detect text in

an image, you're going to have to convert the image to another format. If it's a JPEG image, then you will have to convert it to another format. Even if it's an image created by the OS, you may still have to convert it to another format. This process is called Format Conversion. Format conversion is a part of Image Processing. OpenCV does have support for this process. You can find more information on Format conversion here: [Q: Using Feature Selection in Machine Learning to identify algorithm I am learning about machine learning and I want to try and build an algorithm that predicts the best performing function. I am using the knn, nltk, rpart and e1071 libraries in Python and I have completed a k-nearest neighbors algorithm in which I used the Gini Score as the best performing function. Now I want to use feature selection to try and find other algorithms that will perform better and I have a few questions: How do I know which algorithm to use? Should I just use a metric such as cross validation? How do I know which features to use? It's actually common to use a combination of feature selection \(i.e. to find subsets of features\) and feature engineering \(i.e. making something that is easier to process for a machine learning algorithm than raw data\) to build a predictive model. If you're building a k-nearest neighbors model, then it can be pretty straightforward to do - the nearest neighbors for a given vector are only the k closest to it. Of course, once you've got the k nearest neighbors, you have to do the actual prediction, which can be a rather involved calculation. In your case, you're already doing feature selection, because](#)
